

How to use AIMFix

AIMFix is a virus removal tool for AIM viruses. Download the file to your desktop.

1. Double-click the download file. You will receive a Security Warning message. Just click "Run" to continue.

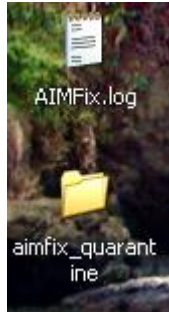

2. The removal tool will run and when it's finished you'll see something similar to this:

Click "Yes" to restart your computer.

3. After your computer restarts you will see two items on your desktop:

The AIMFix.log file will tell you if a virus was found and removed. The aimfix_quarantine folder holds a backup of your AIM settings in case you encounter a problem.

Once you're finished running the virus removal tool and determine that AIM is working properly, you can delete both of these!
